Can this kind of technique be used to treat fine lines and delay the appearance of wrinkles?

Yes. Fine lines are the result of deterioration of the dermis. Dermal filling techniques using hydrafill™ implants are intended for all ages and can prevent and treat the formation of wrinkles.

Are the injections painful?

Generally no. For some of the more sensitive areas (around the lips), an anaesthetic cream or a superficial local anaesthetic can be applied before the hydrafill™ injections for increased comfort. Sometimes your practitioner may utilize a dental block to maximise your comfort during the treatment sessions

What are the common reactions to the injections?

In the hours following your injections, you may see some slight swelling or red marks. These can be masked easily with a foundation cream.

What will my skin look like without additional injections?

The correction will be degraded gradually until the skin returns to its initial appearance. hydrafill™ injections are generally renewed 2 or 3 times in the 1st year, then 1 or 2 times annually thereafter.

Is there a treatment available for men?

Yes. In particular for nasolabial fold and deeper cheek wrinkles
