Cosmetic Dentures

The advances of modern dentistry are astounding. Developments such as Valplast have ushered in a lighter, more comfortable, and more aesthetic removable partial denture.

Discuss your needs with your dentist to determine if Valplast is the right solution for you. You may also be interested to know that the plastic used in Valplast was first developed over five decades ago, and has been used in professional dentistry since 1954. Valplast is in the nylon family, stronger and more flexible than the acrylic used in other kinds of dentures and partials.

Additionally, dentists have recommended Valplast as a viable alternative for full denture patients who have allergic reactions to acrylic.

Even with all the advances of modern dentistry your teeth may not last forever. Fortunately, your dental professional has many options for replacing lost or extracted teeth, among them implants, fixed bridges, removable partial and combinations. The Valplast Flexible Partial is an unbreakable, removable partial that many people find quite comfortable. These lightweight partials are practically invisible, and completely eliminate the metal clasps that you may have seen on other partials.

In fact, most Valplast Flexible Partial are fabricated without the use of a metal frame – made instead from a strong, durable plastic that snaps securely and comfortably into place around your existing natural teeth and gums. The plastic used is so strong that the denture made from it can be very thin, eliminating that heavy, bulky feeling that caused wearing partials so unpleasant in the old days. Plus, the color, shape and design of Valplast.

Flexible Partial blends in well with the natural appearance of your gums, making the partial virtually invisible.
